

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

It had been built with a few twigs as a foundation, and a thick layer of bark, stripped from the cedars and hemlocks which grow about there in profusion, and the whole structure, which was very bulky, was topped off and thoroughly lined with plant down. It looked not unlike a large edition of a Phœbe's or Wood Pewee's nest, and was one of the best built and most comfortable nests I ever saw.

The birds, of which there were several pairs, were still about Camp, but no other nests could be found. They were very tame, and extremely fond of salt, and could often be found paddling about in the drippings under the cold storage house, or perched on a yellow birch beside it. Often they might be seen walking sedately about on the banks around the Camp, and the males with their beautiful, clear and almost metallic notes spent much of their time singing from the tops of some of the neighboring pines, a song that once heard can never be forgotten.

Mr. Geo. W. Smith, one of the guides at Camp, informs me that during the latter part of May, 1890, as he and another guide were going through some low spruce brush near Brandreth Lake, Hamilton County, they found a Crossbill's nest placed at the height of about five feet against the stem of a low spruce tree. The nest contained four or five young, which immediately fluttered off in different directions upon his putting his hand into it. This nest he tells me was similar in construction to the one above cited, except that it was not quite so bulky.—F. H. KENNARD, *Brookline, Mass.*

Peculiar Nest of a Chipping Sparrow.—Regarding the use of unusual materials in the construction of nests, the following note may be of interest. A nest of *Spizella socialis* was found in Boylston, Mass., June 9, 1890, built entirely of hog's bristles. It was very white and neatly made but being placed in the underpinning of a cider mill in an exposed place, where it was quickly discovered by children, it was abandoned before any eggs were laid.—HELEN A. BALL, *Worcester, Mass.*

Harris's Sparrow in British Columbia.—Mr. Brewster states in the last number of 'The Auk' that the second occurrence of Harris's Sparrow (*Zonotrichia harrisi*) in British Columbia is reported by Mr. Brooks from Chilliwack, B. C. The second occurrence of Harris's Sparrow is reported by me in the January number of 'The Auk' taken by Mr. W. B. Anderson at Comox, B. C., on the 20th of November, 1894. (See Auk, January, p. 76, 1895.) On the first of December I received two more specimens of this bird from the same careful observer who reported having seen others. It is very likely Harris's Sparrow is going to make a home in British Columbia. I am certain Mr. Brewster had not seen my notice when he made the statement but this correction is due Mr. Anderson.—J. FANNIN, *Victoria, B. C.*

The Lark Bunting in South Carolina.—One afternoon in the early part of April I noticed a very plump looking Sparrow while I was walk-

ing down a road which had a very thick hedge on one side. This bird was in the top of a bush when I noticed it and it bore a strong resemblance to the Grass Finch (*Poocætes gramineus*), only it was larger. I fired at it with a small collecting pistol and slightly wounded it. Day after day I visited the spot hoping to see the bird again. Eight days afterwards, April 19, early one morning I saw the same bird within a few yards of the place where I had wounded it. It was perched on a low bush and upon seeing me flew down into a field where a lot of White-throated Sparrows were feeding. This time I secured it. Upon examination I was completely puzzled for it was a new bird to me. I had in mind the Lark Bunting (*Calamospiza melanocorys*), and specimens of this bird, kindly sent me by Messrs. Brewster and Chapman, confirmed my suspicions. The bird is an adult female and evidently wintered, as it was moulting about the throat. It seems strange that this bird was taken within 200 yards of the place where I shot the Missouri Skylark, and Little Brown Crane, recorded in recent numbers of 'The Auk.' — ARTHUR T. WAYNE, *Mount Pleasant, S. C.*

Summer Redbird at Saybrook, Conn. — I have recently added another unexpected acquisition to my list of things new in a fine male specimen of the Summer Redbird (*Piranga rubra*) which I secured here in Old Saybrook on the 27th of April last (1895). It seemed to be perfectly contented, as if ignorant that it had wandered off, and whistled as cheerily in the cold rain storm then prevailing as if it was still under sunny skies. This is the first of its species that I have ever seen here. — J. N. CLARK, *Saybrook, Conn.*

Prothonotary Warbler near New York City. — In the early morning of June 2 last, near Yonkers, New York, I had the great pleasure of seeing a Prothonotary Warbler (*Protonotaria citrea*) and listening to its song. The exact locality was rather more than a mile east of the Hudson River, and half that distance beyond Van Cortlandt Park at the northern limit of New York City. In the woods at this point a shallow pond, or pool, spreads itself among a scattered grouping of trees and bushes. This was clearly the attraction which kept the bird about the spot, enabling me to watch it at leisure. It was not at all shy, and much of the time was so near to me that, though my field-glass was not dispensed with, there was no need of it for purpose of identification. The exquisite bird kept constantly over the water, frequently coming into conspicuous view on open horizontal branches and sometimes clinging momentarily against a tree-trunk. Its usual motions were leisurely, the movements of the head sometimes quite Vireonine.

The song, which was repeated at short intervals, though not at all remarkable, was very distinctive, and not fairly to be compared with any other known to me. Listening to it, it seemed as if an unpractised ear might perhaps have associated it with the Golden-crowned Thrush, not-
